

Oracle Fusion Middleware is the most comprehensive family of pre-integrated, industry-leading middleware. Oracle's middleware products embrace a hot-pluggable architecture, for greater flexibility and investment protection.

Oracle's Service-Oriented Architecture (SOA) Suite is a way of integrating disparate software systems and applications so they communicate seamlessly. As the recommended platform for getting started with Fusion Middleware, companies implementing SOA Suite are quickly realizing the benefits of SOA. CedarCrestone has extensive experience architecting, implementing and growing SOA solutions for its clients. The following are the services and solutions that CedarCrestone offers clients so they can rapidly achieve the benefits of deploying SOA in their environment:

- **SOA Suite Services:** One of our core service offerings is implementing the components of Oracle SOA Suite including BPEL Process Manager, Business Activity Monitoring, Business Rules, Service Bus, Web Services Manager, and Complex Event Processing. Oracle SOA Suite is a complete set of service infrastructure components for building, deploying and managing SOAs. Oracle SOA Suite enables services to be created, managed, and orchestrated into composite applications and business processes.
- **SOA Suite Training:** CedarCrestone's Oracle SOA Suite training is based on real-world implementation experience and covers basic through advanced courses that are tailored to your organization. For more information, please contact training@CedarCrestone.com.
- **SOA Suite Composite Application Development:** Helps customers execute and deliver their Fusion Middleware Application Development goals. Composite Applications help deliver new Web Applications that take advantage of existing systems utilizing SOA. Core to the CedarCrestone Development methodology is the philosophy of "early and continuous delivery of valuable software." This implies a highly iterative approach, a strategy for which we identify business issues with manageable scope, rapidly deliver on them, and then expand the solution to encompass an increasing "circle of capabilities."
- **SOA Suite Solutions Packages:** CedarCrestone offers a deep repository of industry and function specific solution packages. Consistent with SOA principals, our solution packages reduce Client time and investments thru leveraging common SOA composite applications, services, and solutions. Delivered thru either CedarCrestone or Client hosted environments, SOA solution packages have been architected and packaged to meet common industry and process functions.
- **A Taste of SOA:** CedarCrestone offers a turnkey SOA pilot project solution inclusive of SOA software, hosting and consulting. All delivered at a fraction of the traditional cost and risk. Once piloted and rolled out, Clients can opt to continue hosting SOA with CedarCrestone or transition SOA to internally hosted systems. A Taste of SOA is a turnkey, low risk and cost effective method for implementing and growing SOA solutions.
- **Independent Software Vendors (ISVs) Programs:** For ISVs looking to develop enhanced product integration and distribution channels, CedarCrestone is uniquely positioned as a business partner. ISVs can leverage new Oracle distribution channels, SOA Suite integration platform, and packaged Oracle application integration. With CCI's implementation services, ISVs benefit from expediting the development, deployment, and maintenance of reusable Oracle Integration solutions. ISVs also benefit from CedarCrestone's years of experience navigating and selling into the Oracle and Oracle application customer ecosystem.
